

Problem Statement

Java

Create a class Employee with data member id, department and sal.

For **department** three values there are Manager, HR, Finance for these three companies provide bonuses as 25000, 20000 and 18000 respectively.

Your task is to create an array of Employee where the array size is given by the user. Initialize the data members using constructor and finally print the total salary of the employee (**sal+bonus**) occupied by each employee.

You can create methods in class as per your requirement.

To compare the department please use the String class equals() method.
